Project Name	
Maximum Marks	4 Marks

Solution Architecture:

The proposed solution architecture uses ServiceNow Incident Management with Client Scripts and UI Policies to control form behavior, validate user input, and dynamically manage field visibility, mandatory status, and read-only behavior. The solution is designed to improve data quality, reduce user errors, and provide a consistent incident-creation and update experience.

- Find the best tech solution to solve existing business problems.
- Describe the structure, characteristics, behavior, and other aspects of the software to project stakeholders.
- Define features, development phases, and solution requirements.
- Provide specifications according to which the solution is defined, managed, and delivered.

Solution Architecture Diagram:

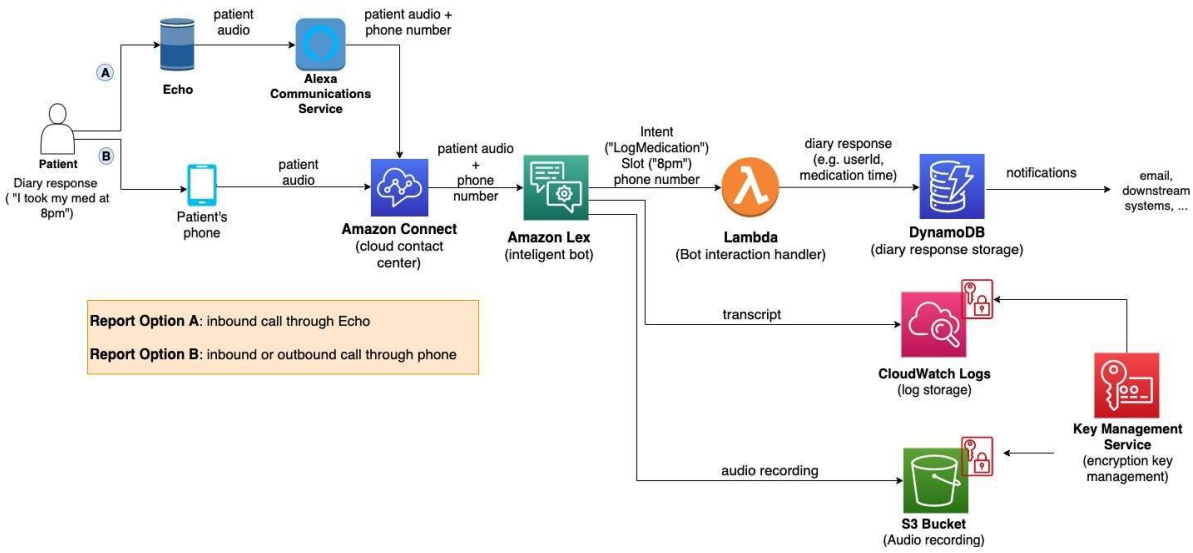

Figure 1: Solution architecture and data flow for Incident Client Script and UI Policy

Reference: ServiceNow Incident Management – Client Scripts and UI Policies configuration

Architecture Flow: Incident User → Incident Form → UI Policy evaluation → Client Script validation/automation → Field visibility/mandatory/read-only changes → Incident submission/update → Validated Incident record.

Key Components: ServiceNow Incident table, Incident form, Client Scripts (onLoad/onChange/onSubmit), UI Policies, form fields, client-side validation, and incident record storage.
