1. Introduction

• Project Title: Implement Client Script and UI Policy (Incident)

• Team Members: List team members and their roles.

2. Project Overview

• Purpose: Implement Client Scripts and UI Policies on the ServiceNow Incident form to improve form behavior, validation, and user interaction.

• Features: Client-side field validation, automatic field updates, field visibility control, mandatory field control, and read-only field control.

3. Architecture

• Platform: ServiceNow platform with the Incident application and Incident table.

• Client Script: Describe the client-side scripts used to validate or update Incident fields based on user actions.

• UI Policy: Describe the UI Policies used to control field visibility, mandatory status, and read-only behavior based on conditions.

4. Setup Instructions

• Prerequisites: Access to a ServiceNow instance with permission to configure the Incident table.

• Configuration: Create the required Client Scripts and UI Policies under the Incident application and configure their conditions, scripts, and field actions.

5. Configuration Structure

• Client Scripts: Contains the Client Scripts configured for the Incident form.

• UI Policies: Contains the UI Policies and UI Policy Actions configured for Incident fields.

• Incident Form: Contains the fields and form behavior affected by the configured rules.

6. Running the Application

• Open the ServiceNow application and navigate to the Incident module.

• Open a new or existing Incident record and verify that the configured Client Scripts and UI Policies execute according to their conditions.

7. Script and Configuration Documentation

• Document each Client Script, including its type, table, condition, and purpose.

• Document each UI Policy, including its table, condition, and UI Policy Actions.

8. Authentication

• Access to the ServiceNow Incident application is controlled through the configured ServiceNow user roles and permissions.

• Only authorized users should create, modify, and configure Incident records and Client Script/UI Policy configurations.

9. User Interface

• Provide screenshots of the Incident form before and after Client Script and UI Policy conditions are applied.

• Show field validation, visibility, mandatory, and read-only behavior.

10. Testing

• Test Client Scripts using positive and negative Incident form scenarios.

• Test UI Policies to verify field visibility, mandatory status, and read-only behavior.

• Verify that the configured rules execute correctly without affecting unrelated Incident fields.

11. Screenshots or Demo

• Provide screenshots of the Incident form, Client Script configuration, UI Policy configuration, and the resulting field behavior.

• Provide a ServiceNow instance/demo reference if available.

12. Known Issues

• Document any Client Script validation issues, UI Policy conflicts, incorrect conditions, or unexpected Incident form behavior identified during testing.

13. Future Enhancements

• Add additional Client Scripts for advanced Incident validation and automation.
• Add more UI Policies for dynamic Incident form behavior.
• Improve validation and automation based on future Incident management requirements.
